

COGNITIVE INVOICE DATA CAPTURE ENABLES INVOICE AUTOMATION WITHIN DMS

By implementing Elis, a DMS provider can now offer complex services for invoice automation on top of their EDI competencies.

SITUATION:

A DMS provider ran a system for processing EDI invoices and other documents for a large group of clients. Their clients could process EDI invoices, while PDF and scanned invoices must have been handled manually. The DMS provider desired to offer a full-scope automation service for EDI and PDF/scanned invoices.

SOLUTION:

The DMS provider implemented the API Elis by Rossum into their DMS, enabling them to automatically extract data from scanned and PDF invoices, with the following benefits:

- **No templates needed:** Elis does not require a lengthy and expensive setup of rules or templates.
- **Ability to extract invoices from SME:** Elis can extract data from invoices with very different layouts and formats with human-level accuracy, even if the invoice is in a previously unseen format.
- **Smooth integration:** Rossum offers a wide range of APIs, easily integrated into any DMS system.
