

Rossum integration with Oracle NetSuite

Overview

Rossum seamlessly integrates with NetSuite Oracle through a native integration, offering a powerful solution for automating document processing and minimizing the risks of data integration.

Key benefits

- 1. Seamless Oracle NetSuite integration:** Rossum's integration offers a range of components ensuring smooth compatibility with your Oracle NetSuite system. This means you can seamlessly incorporate Rossum's document processing capabilities. Rossum's NetSuite integration is highly customizable to fit around your business logic.
- 2. Automated AP document processing:** say goodbye to manual data entry and validation. Our integration leverages AI to extract data from transactional documents (invoices, purchase orders, sales orders, etc.), validate and transport the data to Oracle NetSuite. It also attaches the original PDF document, simplifying auditing and compliance.
- 3. Master data management:** keep your master data up-to-date effortlessly. Rossum's solution replicates master data using Oracle NetSuite SOAP API integration for advanced validation capabilities, ensuring the accuracy of your document processing.

Components

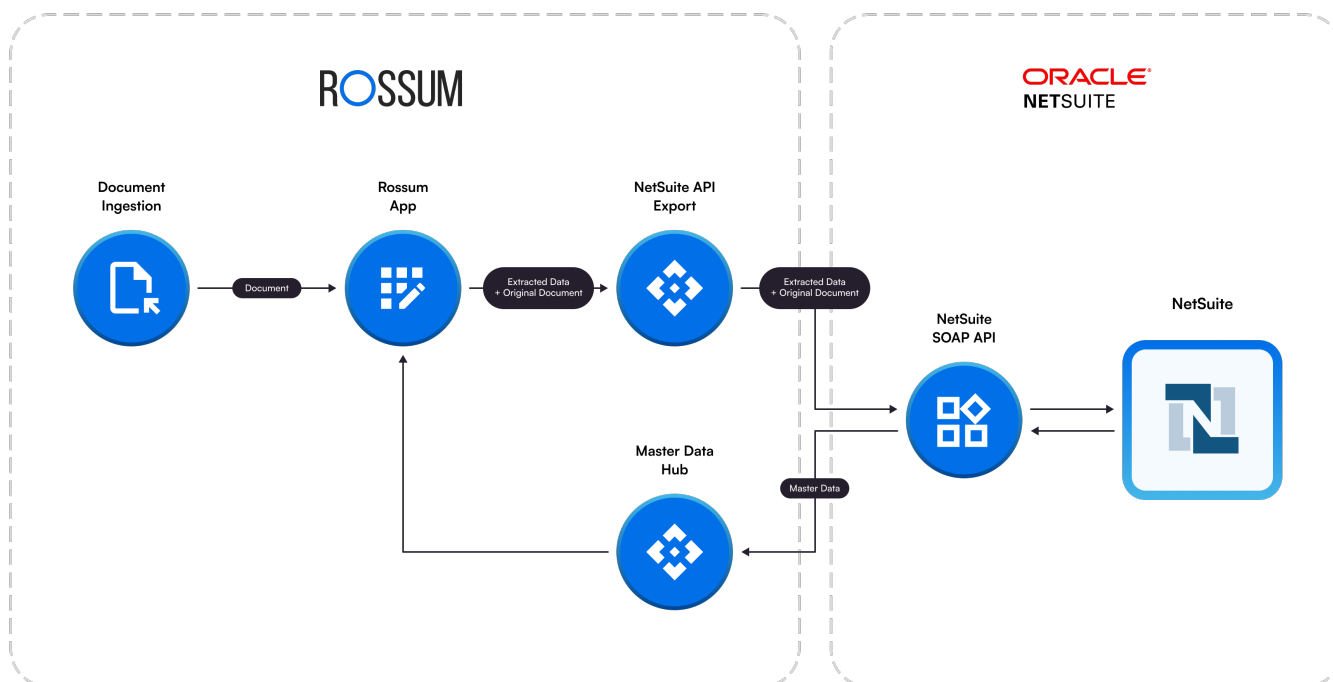

Rossum's **Oracle NetSuite API** integration consists of two core components:

1. NetSuite API Export:

- Exports Validated Documents to Oracle NetSuite
- This component transforms annotated document data (invoice, purchase order, etc.) into NetSuite API payloads, sending the extracted data to Oracle NetSuite and attaching original documents for comprehensive records.
- Rossum exports:
 - **Invoices/Purchase orders.**
 - **Attachments:** the original invoice documents for reference and auditing.

2. Master Data Hub:

- Efficiently synchronize master data from Oracle NetSuite on a scheduled basis and store it securely in Rossum's Master Data Hub for easy and fast validation of data in the received documents.
- Example Master Data lists:
 - **Vendors:** uses vendor details for invoice matching.
 - **Purchase orders:** ensures accurate invoice matching.
 - **Accounts, cost centers** (General Ledger codes): for accurate financial categorization.
 - **Tax codes:** ensures correct tax calculations.

Configuration requirements

Customers need to provide:

- Access to the NetSuite SOAP API with related integration tokens with appropriate permissions to all the imported and exported objects.
- Optional access to NetSuite environment for faster integration.

Safe and secure

Our dedicated security, privacy and compliance teams ensure your data is protected. We follow security standards for integration with Oracle NetSuite APIs and also undergo regular audits for SOC 2 and ISO 27001 certification compliance.

The Rossum Platform
